Submitted (FEB-1997) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: Release of an unsubstituted, C-terminal glutamyl residue, typically from Ac-Asp-Glu or pteroyl-gamma.
-!- COFACTOR: Zinc; Binds two ions per subunit (By similarity).
-!- SUBCELLULAR LOCATION: Type II membrane protein.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M28B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-FEB-2003 (Rel. 41, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: May modulate the level of one or more small signaling molecules that have a role in regulating meristem function. CATMALYTIC ACTIVITY: Release of an unsubstituted, C-terminal glutamyl residue, typically from Ac-Asp-Glu or pteroyl-gamma. COFACTOR: Zinc; Binds two lons per subunit (By similarity). SUBCELLULAR LOCATION: Type II membrane protein. TISSUE SPECIFICITY: Expressed in all plant parts. Highest levels in the bolt stem, inflorescence, root and silique. Low level in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CYCD3 expression.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M28B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MISCELLANEOUS: Ampl mutants show pleiotropic phenotypes, including altered shoot apical meristems, increased cell proliferation, polycotyly, constitutive photomorphogenesis, early flowering time, increased levels of endogenous cytokinin, and increased cyclin
                                                                                                                                                                                                                                                                                                                                                                                              PF02225; PA; 1.

"Comparative analysis of the gene-dense ACHE/TFR2 region on human "Comparative analysis of the gene-dense ACHE/TFR2 region on human chromosome 7q22 with the orthologous region on mouse chromosome 5."; Nucleic Acids Res. 29:1352-1365(2001).

1- FUNCTION: Mediates cellular uptake of transferrin-bound iron in non-iron dependent manner. May be involved in iron metabolism, hepatocyte function and erythrocyte differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Richards S., Worley K.C., Hale S., Garcia A.M., Gay L.J., Hulyk S.                                                                                                                        expressed in kidney, spleen, brain, lung, heart and mu very low expression in kidney, muscle and heart. DEVELOPMENTAL STAGE: First expressed beween embryo day In the liver, expression increases during development day 13 to adulthood while, in the spleen, levels remained.
                                                                                                                                                                                                                                        Name=3;
IsoId=Q9JKX3-3; Sequence=VSP_005356;
TISSUE SPECIFICITY: Predominantly expressed in liver. Also
throughout development.
INDUCTION: Down-regulated during erythrocyte differentiation.
Expression unchanged by cellular iron status.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M28B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ALTERNATIVE PRODUCTS:

1- FUNCTION: Cellular uptake of iron occurs via receptor-mediated
endocytosis of ligand-occupied transferrin receptor into
specialized endosomes. Endosomal acidification leads to iron
release. The apotransferrin receptor complex is then recycled the cell surface with a return to neutral pH and the concomitar
loss of affinity of apotransferrin for its receptor. Transferri
receptor is necessary for development of erythrocytes and the

Endosomal acidification leads to iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     release. The apotransferrin-receptor complex is then recycled to the cell surface with a return to neutral pH and the concomitant loss of affinity of apotransferrin for its receptor. Transferrin receptor is necessary for development of erythrocytes and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ulcerative colitis, Fetal thymus, Cervix, Cervixal adenosquamous carcinoma, Ligament cells, Prostate carcinoma, Bladder carcinoma, Brain oligodenroga; NCI_CGAP_Sub9 is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is sequence tags for this library are CGTC, AACG, GGGCC, GGAAG, TAACC, ATGC, AGCA, ATCAC. For additional information.
